FUNCTION: Isoform 2 lacks activity is an dominant-negative inhibitor of cappase-9.
SUBUNIT: Heterodimer of a 35 kDa (P35) and a 10 kDa (P10) subunit. Caspase-9 and APAPI bind to each other via their respective NH2-terminal CED-3 homologous domains in the presence of cytochrome C
                                                                                                                                                                                                                                                                                                                                                                           SEQUENCE FROM N.A. Might function by either activating some proteins required for cell death or inactivating proteins necessary for cell survival (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IsoId=Q98943-2; Sequence=VSP 000803, VSP 000804;
-!- PTM: Heterodimer of a small and a large subunit (By similarity).
-!- SIMILARITY: Belongs to peptidase family C14.
-!- SIMILARITY: Contains 1 CARD domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             STRAIN=White leghorn; TISSUE=Cvarian granulosa; MEDLINE=97368127; PubMed=9224894; Johnson A.L., Bridgham J.T., Bergeron L., Yuan J.; "Characterization of the avian Ich-1 cDNA and expression of Ich-1L

EMBO J. 15:1012-1020 (1996).

- FUNCTION: Involved in the activation cascade of caspases

- responsible for apoptosis execution. At the onset of apoptosis it proteolytically cleaves poly(ADP-ribose) polymerase (PARP) at a proteolytically 17 bond. Cleaves and activates sterol regulatory element binding proteins (SREBPS) between the basic helix-loophelix lenoine zipper domain and the membrane attachment domain.

- cleaves and activates caspase-6, -7 and -9 (By similarity).

- SUBUNIT: Heterodimer of a 17 kDa (p17) and a 12 kDa (p12) subunit

RI "Cleavage of huntingtin of activation cascade of caspases of responsible for apoptosis execution. At the onset of apoptosis it proteolytically cleaves poly(ADP-ribose) polymerase (PRRP) at a 216-Asp-|-Gly-217 bond. Cleaves and activates sterol regulatory helix leucine zipper domain and the membrane attachment domain. Cleaves and activates caspase-6, -7 and -9. Involved in the cleavage of huntingtin.

CC -leavage of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright. TISSUE SPECIFICITY: High level expression seen in the embryonic CNS, liver, lung, kidney, small intestine, and hair follicles of vibrissae. Noderate expression seen in the skin, oral mucosa, skeletal muscle, submandibular gland and thymus. In the adult, it is highly expressed in spleen, lung and kidney. Moderately in the Drain, heart, testis, liver. Low levels in the thymus, skeletal DBVELOPMENTAL STAGE: During embryonic development is highly expressed in several types of mouse tissue undergoing high rates of programmed cell death such as central nervous system and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Kumar S., Tomooka Y., Noda M.;
"Identification of a set of genes with developmentally down-regulated expression in the mouse brain.";
Biochem. Biophys. Res. Commun. 185:1155-1161(1992).
-!-FUNCTION: Involved in the activation cascade of caspases responsible for apoptosis execution. Might function by either activating some proteins required for cell death or inactivating proteins necessary for cell survival. May be important in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- PTM: THE MATURE PROTEASE CAN PROCESS ITS OWN PROPEPTIDE, BUT NOT THAT OF OTHER CASPASES (BY SIMILARITY).
-!- SIMILARITY: Belongs to peptidase family C14.
-!- SIMILARITY: Contains 1 CARD domain.

PTM: CLEAVAGE BY GRANZYME B, CASPASE-6, -8 AND -10 GENERATES THE PTM: CLEAVAGE BY GRANZYME B, CASPASENG OF THE PROPEPTIDES IS LIKELY DUE TO THE AUTOCATALYTIC ACTIVITY OF THE ACTIVATED PROTEASE. ACTIVE HETERODIMERS BETWEEN THE SMALL SUBUNIT OF CASPASE-7 PROTEASE AND THE LARGE SUBUNIT OF CPP32 ALSO OCCUR AND VICE VERSA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBCELLUIAR LOCATION: Cytoplasmic.
TISSUE SPECIFICITY: EXPRESED IN HEART, BRAIN, LIVER, AND MUSCLE BUT NOT IN KIDNEY OR TESTIS.
DEVELOPMENTAL STAGE: Highly expressed in neuron-enriched regions of the developing brain, but down-regulated to low levels in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Noi B., Wu X., Du Y., Su Y., Hamilton-Byrd B., Rockey P.K.,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ISOId=P42575-2; Sequence=VSP 000801, VSP 000802;
Note=Acts as a negative regulator of apoptosis;
-!-ISSUE SPECIFICITY: Expressed in larger amounts in the embryonic lung, liver and kidney than in the heart and brain. In the adults higher level expression is seen in the placenta, lung, kidney, pancreas than in the heart, brain, liver and skeletal muscle.
-!- PIM: THE MATURE PROTESS CAN PROCESS ITS OWN PROPEPTIDE, BUT NOT THAT OF OTHER CASPASES.
                                                                                                                                                                                                                                                                           CPP32 protease.",

Genes Dev. 10.1073-1083(1996).

-!- FUNCTION: Involved in the activation cascade of caspases
responsible for apoptiosis execution. Might function by either
activating some proteins required for cell death or inactivating
proteins necessary for cell survival.

-!- SUBUNIT: Heterodimer of a small and a large subunit (By

                                                                                                                                                                                    Cell 75:641-652(1993).

-!- FUNCTION: Acts as a cysteine protease in controlling programmed cell death by proteolytically activating or inactivating a substrate protein or proteins, a potential substrate may be ced-4 Alternatively it might directly cause cell death by proteolytically cleaving proteins that are crucial for cell viability (By similarity).

-!- SUBUNIT: Could be a heterodimer of two subunits derived from the

Kioschis P., Kischkel F., Poustka A., Krammer P.,

Submitted (JUL-1997) to the EMBL/GenBank/DDBJ databases.

-:- FUNCTION: Most upstream protease of the activation cascade of caspases responsible for the TNRSF6/RAS mediated and TNFRSF1A induced cell death. Binding to the adapter molecule FADD recruits it to either receptor. The resulting aggregate called death-inducing signaling complex (DISC) performs CASP8 proteolytic cativation. The active dimeric enzyme is then liberated from the DISC and free to activate downstream apoptotic proteases.

CC DISC and free to activate downstream apoptotic proteases.

Proteolytic fragments of the N-terminal propeptide (termed CAPS) activates CASP3, CASP4, CASP6, CASP7, CASP9 and CASP10, May cativates CASP3, CASP4, CASP6, CASP7, CASP9 and CASP10, May participate in the GZMB apoptotic pathways. Cleaves and activates cASP3, CASP4, CASP6, CASP7, CASP9 and CASP10, May participate in the GZMB apoptotic pathways. Cleaves ADRT.

Hydrolyzes the small-molecule substrate, Ac-Asp-Glu-Val-Asp-HAMC.

-:- ENZYME REGULATION: Inhibited by Z-VAD-FK, Crma and P35.

-:- SUBUNIT: Heterodimer of a 18 kDa (P18) and a 10 kDa (P10) subunit.

CC -:- TISSUE SPECIFICITY: Expressed in a wide variety of tissues.

CC -:- TISSUE SPECIFICITY: Expressed in a wide variety of tissues.

CC -:- DEVELOPMENTAL STAGE: In the embryo, highest expression occurs at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- PTM: Generation of the subunits requires association with the death-inducing signaling complex (DISC), whereas additional processing is likely due to the autocatalytic activity of the activated processe. GZMB and GASP10 can be involved in these processing events (By similarity).
-: SIMILARITY: Belongs to peptidase family C14.
-: SIMILARITY: Contains 2 death effector (DED) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            modified and this statement is not removed.

                                                                                                                                                                                        FUNCTION: Acts as a cysteine protease in controlling programmed cell death by proteolytically activating or inactivating a substrate protein or proteins, a potential substrate may be ced-4. Alternatively it might directly cause cell death by proteolytically cleaving proteins that are crucial for cell
                                                                                                                                                                                                                                                                   viability.
SUBUNIT: Could be a heterodimer of two subunits derived from the
                                                                                                                                                                                                                                                                                               precursor sequence by a probable autocatalytic mechanism. DEVELOPMENTAL STAGE: Most abundant during embryogenesis and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Thiol protease, Zymogen; Apoptosis; Phosphorylation. 1 371 CELL DEATH PROTEIN 3 SUBUNIT 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (POTENTIAL).
CELL DEATH PROTEIN 3 SUBUNIT 2
                                                                                                                                                                Durbin R.;
Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
                             Horvitz H.R.;
Submitted (DEC-1999) to the EMBL/GenBank/DDBJ databases.
                                                                                                                   to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                                                                                                                                                                                              also detected at later stages.
PTM: May be regulated by phosphorylation.
SIMILARITY: Belongs to peptidase family C14.
SIMILARITY: Contains 1 CARD domain.

caspases responsible for the TNPRSF6/FAS mediated and TNFRSF1A induced cell death. Bindings to the adapter molecule FADD recruits it to either receptor. The resulting aggregate called death-inducing signaling complex (DISC) performs CASPB proteolytic activation. The active dimeric enzyme is then liberated from the DISC and free to active downstream apoptotic proteases. Proteolytic fragments of the N-terminal propeptide (termed CAP) proteolytic fragments of the N-terminal propeptide (termed CAP) activates CASP3, CASP4, CASP5, CASP7, CASP9 and CASP10. May participate in the GZMB apoptotic pathways. Cleaves and activates the small-molecule substrate, Ac-Asp-Glu-Val-Asp-|-AMC-Likely target for the cowpox virus CRMA death inhibitory protein. Isoforms 5, 6, 7 and 8 lack the catalytic site and may interfere with the pro-apoptotic activity of the complex.

-!- SUBUNIT Heterodimer of a 18 kbm (P18) and a 10 kbm (P10) subunit. Interacts with FADD, CFLAR and PBA15. Isoform 9 interacts at the endoplasmic reticulum with a complex containing BCAP31, BAP29, BCL211.

-!- SUBCELLULAR LOCATION: Cytoplasmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          408

                                                                                                                                                                                                                                                                                                                                                                                                                                    SUBUNIT: Heterodimer of a 20 kDa (p20) and a 11 kDa (p11) subunit (By similarity).
SUBCELJULAR LOCATION: Cytoplasmic.
SUBCELLULAR LOCATION: Cytoplasmic.
SUBUNITS. PROPEPTIDE DOMAINS CAN ALSO BE CLEAVED EFFICIENTLY BY CPRASASE. 70 KTUVE HETERODIMERS BETWEEN THE SMALL SUBUNIT OF CASPASE. 7 AND THE LARGE SUBUNIT OF CPP32 PROTEASE ALSO OCCUR AND VICE VERSA (BY SIMILARITY).
SIMILARITY: Belongs to peptidase family C14.

"Purification and cDNA cloning of a second apoptosis-related cysteine protease that cleaves and activates sterol regulatory element binding
                                                                                                                                                                                                                                                                                                            Proc. Natl. Acad. Sci. U.S.A. 93:5437-5442(1996).
-!- FUNCTION: Involved in the activation cascade of caspases responsible for apoptosis execution. Cleaves and activates sterol regulatory element binding proteins (SREBPS). Proteolytically cleaves poly(ADP-ribose) polymerase (PARP) at a 216-Asp-|-Gly-217 bond. Overexpression promotes programmed cell death (By
                                                                                 Mesocricetus auratus (Golden hamster).

P32 protein - mouse
Species: Mus musculus (house mouse)
Species: Mus musculus (house mouse)
Accession: 10-Jun-1997 #sequence_revision 18-Jul-1997 #text_change 17-Mar-1999
Accession: JC5410
Mukasa, T.; Urase, K.; Momoi, M.Y.; Kimura, I.; Momoi, T.
Ochem. Biophys. Res. Commun. 231, 770-774, 1997
Title: Specific expression of CPP32 in sensory neurons of mouse embryos and activation/
Reference number: JC5410; MUID:97224429; PMID:9070890
Status: nucleic acid sequence not shown
Molecule type: mRNA
Title: Ich-1, an Ice/ced-3-related gene, encodes both positive and negative regulators
Reference number: A54821; MUID:94373811; PMID:8087842
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Residues: 1-277 «MUX»
